

Atypical Gout - Am I at Risk?

Gout is a painful disease that millions of people suffer from every year. It is a response to an inflammation around the joints from crystallized deposits. Generally, this condition is completely preventable. In cases where a person has been diagnosed with atypical gout, it can be managed by different methods that usually eliminate or minimize the discomfort.

- Typically a person first experiences a painful bout with gout in their big toe knuckle area.
- However, several have reported the pain was first in some other joints, such as the hand.
- In the event that gout is experienced in the hand it is generally the hand that the person use for almost everything, his or her dominant hand.
- Many situations gout has been linked to heredity.
- If someone in the family has had gout and even arthritis your risk of also being diagnosed with gout is elevated.
- However, you can take precautions to be able to decrease your risks.

Eating healthy foods that are low in purines, increasing your leafy greens and fiber intake are great ways to do this. Another modification you can take is to exercise regularly. This will help you to lose unnecessary weight as well as increase blood flow and decrease the uric acids that turn into the crystallized deposits.

- Increase your water consumption to be able to between 10-12 glasses a day.
- This helps your body to purge the toxins from it, aids in digestion and maintains hydration for overall health.
- Is very important if you know you are at a higher risk for gout that you take the necessary precautions to lessen your risks.
- Talk to your doctor is you have any questions or concerns.
- He or she can also help you in determining the best diet for you so you can lower your risks.
